

**In the Specification:**

*Please amend the paragraph at page 9, lines 16-22 as follows:*

Lysolipid MSPC basically encompasses C12-C18 monoacyl lysolipids. It should be appreciated that longer acyl chains can be included preferably if the head group is made more soluble. Moreover, other suitable surface active agents may include, for example, a dichain phospholipid having chains preferably of no greater than C10, glycolipids, and bile salts that are quite surface active but will enter a bilayer without dissolving it at concentrations less than their CMC, which can be as high as tens of milliMolar.
